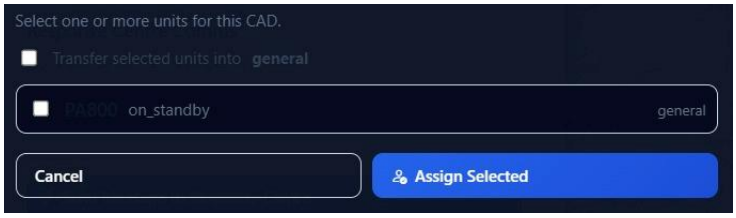
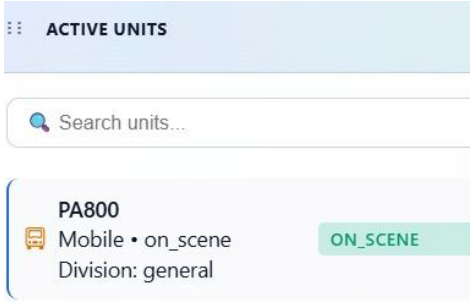
Update on_standby formatting to look more professional

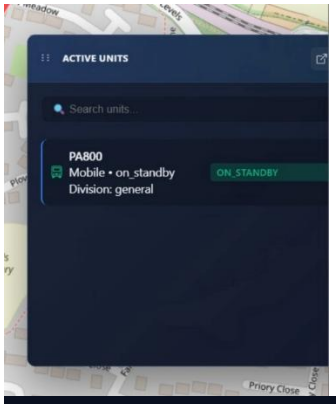


Update on_scene formatting to look more professional. Remove status message duplicate – I would keep the nice colourful one. Also, why does it say mobile at this stage? I assume a 'terrafixism'.

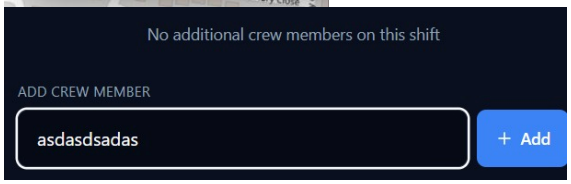


I like this but like I mentioned perhaps the callsign permanently displayed below to save me hovering over each one trying to find the location of a specific resource. Also, maybe small status message underneath so you can see who is available etc.

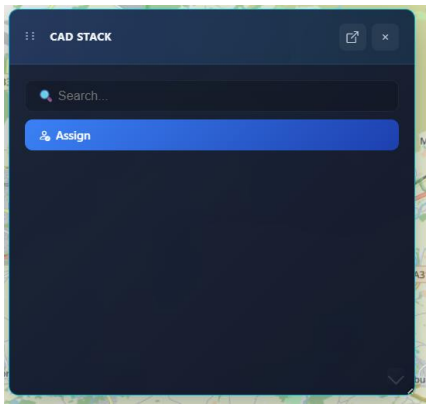
Auto adjustment of menus when window size adjusted. Saves not being able to close them if you shrink your window



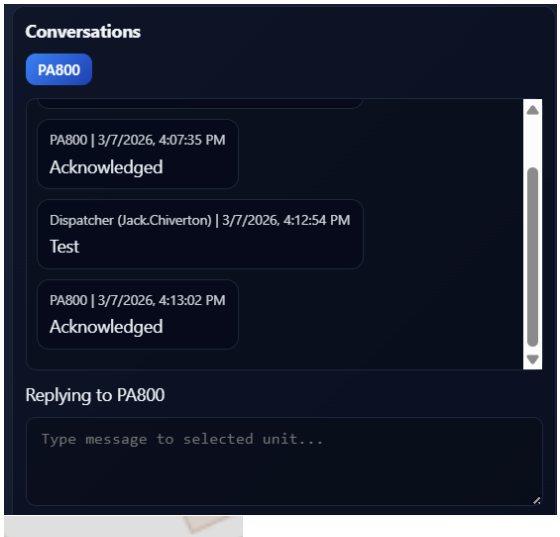
Add error message when trying to add crew members that do not exist



Option for dispatcher to create CADs. Running calls etc. Saves opening up the other page. Little plus button somewhere near top. Not sure why the assign button is there either. I would have one assign button per job myself – if that makes sense.

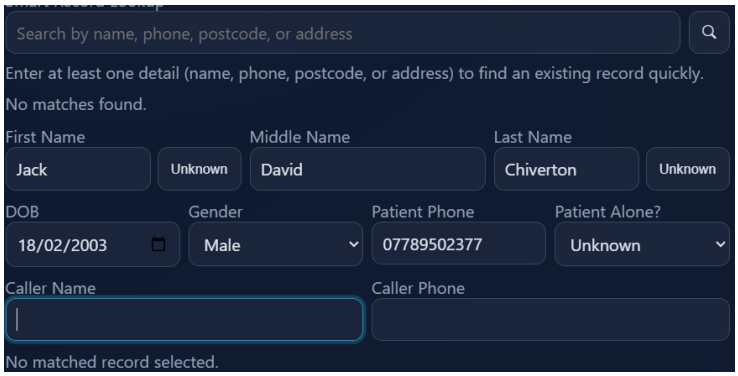


The ability to minimise conversations. At a busy event you might have lots of resources. So, the ability to minimise each conversation would be good. Otherwise, you will be scrolling finding who you want to message.



I don't like this point on the callsign bubble but I will leave that up to you.

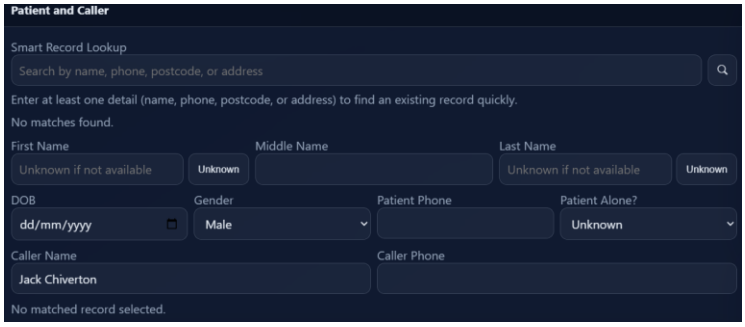
Perhaps the ability to quicky duplicate the patients details if they are the same as the caller. For example, SMART Storm which is what a lot of police forces use can do this with the incident address and caller address if it's the same. We double click in the incident address box and copies into the other. Although you could make it simpler and add a button… idiot proof.



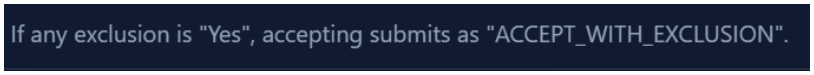
No option for unknown middle name. Perhaps might be best to add one unknown button at the end of the name row that fills all 3.

Also, when you have typed in any name sections then click unknown it only removes the entered data doesn't replace it with unknown.

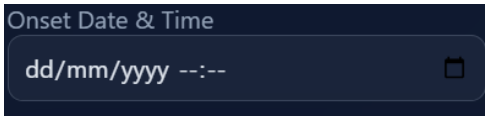
No option for Unknown DOB, gender or patient phone number. Again, perhaps one button at the end of the row.



Minor formatting again remove those underscores etc which I assume are being pulled from the backend.

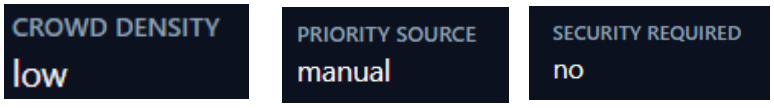


Unknown option might be good here as if security have come across them etc who knows how long they've been dead on the floor.

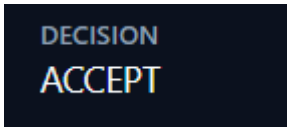


This is me being pedantic but "Ventus" or "VENTUS". I like things uniform.

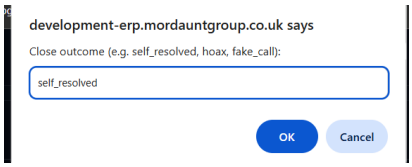
MDT screen when job details appear. Pedantic again but capitalise the first letters. Low, Manual and No.



Little confused by this. Surely, if not accepted then they wouldn't be sent the job lol. If it is needed then again perhaps capitalisation fixing.



Back to CAD now. I flick between tabs and the resources/units don't show up. I refreshed a couple times then still nothing then randomly they pop back in.

Response centre now – formatting of "cleared" again me being pedantic as fuuuckk.


This is great. But having to type the exact wording with underscores perhaps is a bit annoying for some. Would a drop down menu be possible that opens? Rather than the chrome pop up thing. I would include an "Other (please specify" option.
